How do i fix my android keyboard not appearing. How to fix the keyboard on an android phone. How do you fix a split keyboard on android.

Once you know how to change keyboard on Android you won't look back. In fact, one of the best things about Android phones is the ability to change the keyboard whenever you feel like it. Indeed, when I get a new phone, unless it ships with Google's excellent GBoard, that's pretty much the first thing I do. Whether you're a fan of SwiftKey, Swype or Fleksy, switching Android keyboard is something that's both easy to do and guaranteed to make your phone more usable — especially if you're the kind of person who likes to write long emails on the go. Third-party keyboards offer swipe typing, gesture controls, specialized layouts and more. Here's how to change keyboard on Android to take advantage of these extra features.

1. First things first, you need to find the keyboard you want to use. This is done via the Google Play Store, so open the app and search for "keyboard." While you can allow yourself to be guided by reviews and popularity, we've tried and tested some of the best Android keyboard apps so you don't have to. (Image credit: Alan Martin) 2. Once you've found the keyboard you want, tap the "Install" button to download it to your Android phone. We're using Microsoft's SwiftKey for the purposes of this demonstration. (Image credit: Alan Martin) 3. Open "Settings" on your Android phone. How you get here depends on your handset, but it can usually be found in the app drawer, or by swiping down at the top of the screen and pressing the cog icon. (Image credit: Alan Martin) 4. Next, you need to find the keyboard settings. Again, this varies by handset. On phones that run on a clean version of Android, you want to go to System > Languages & Input, but on the Samsung Galaxy S10e we're using, the path is System > General Management > Keyboard list. If you can't see the route on your flavor of Android, don't be afraid to search for the word "keyboard" using the magnifying glass icon at the top of the Settings list. (Image credit: Alan Martin) 5. Next you need to enable your downloaded keyboard. Again, how you do this will depend on which version of Android you have and which handset you're using. For instance, you may need to add the keyboard by pressing "Manage keyboards." On Samsung's version, SwiftKey was there, ready to select, so we just tapped the toggle to switch it on. (Image credit: Alan Martin) 6. You'll likely get a warning that the custom keyboard can collect data including passwords and credit card numbers. This would normally be cause for concern, but given keyboard apps literally need this ability to function, it's fine here — assuming you've downloaded a reputable keyboard in the first place. If in doubt, do more research, if not accept and move on. (Image credit: Alan Martin) 7. To Switch to your new keyboard on Samsung phones, you can just tap the "Default keyboard" box at the top of the page, and set it automatically. If that's not an option, this alternative should work on every device. Open up any app that uses a keyboard (your web browser, Gmail, WhatsApp — literally anything), and then tap the keyboard icon in the bottom right-hand corner, as pictured below. (Image credit: Alan Martin) 8. Select your chosen keyboard, and it'll switch, ready for you to type away. (Image credit: Alan Martin)

Today's best pixel 4a deals (opens in new tab) (opens in new tab) (opens in new tab) (opens in new tab) (opens in new tab) If you're looking for a better mobile typing experience on your Android phone, you have tons of options. Last week, we asked you for your favorites, then we looked at the five best Android keyboards based on those nominations. Now we're back to highlight the crowd favorite. One great thing about Android is that you can use whatever keyboard suits your needs. Custom... Read more

Knocking it out of the park with over 53% of the overall vote was SwiftKey, the swipe-to-type Android keyboard with predictive text, custom dictionaries, cloud-saved preferences, and the ability to learn from the way you type. It probably doesn't hurt that SwiftKey recently went free, dropping its premium price tag and opening the door to the masses. Still, it was the top dog last time we asked about your favorite keyboards, and its lead has only grown since then. In second place with close to 26% of the vote was the Google Keyboard, a keyboard which barely placed last time, but since then has added swipe-to-type, predictive text, and the ability to learn from the way you use other Google services. For many of you, there's just no need to install another keyboard—Google's baked in one does everything for you. Third place goes to Swype, with close to 14% of the overall vote. The keyboard that started the gesture typing phenomenon is still going strong, and adding features like "living language," which adds words based on their use on the web, and easy language switching. Bringing in 5% of the vote and fourth place was Fleksy, a minimalist keyboard that's customizable and boasts autocorrect so strong that even the visually impaired could use it. Finally, in fifth place with 2% of the vote was Minuum, the minimalist keyboard that gives you more screen space and a single keyboard row at the bottom of the screen. For more on these and the honorable mentions not listed here, make sure to head back to the full Hive Five feature to read more. The Hive Five is based on reader nominations. As with most Hive Five posts, if your favorite was left out, it didn't get the nominations required in the call for contenders post to make the top five. We understand it's a bit of a popularity contest. Have a suggestion for the Hive Five? Send us an email at tips+hivefive@lifehacker.com! Finding the perfect Android keyboard is no easy task—there are so many to choose from, and most of... Read more

We're now so reliant on smartphones for so much of our day-to-day lives that everything can grind to a halt when something goes wrong with them - from keeping in touch with our nearest and dearest to trying to get a payment through on a banking app. Whether you've got an important Snapchat to send or a crucial email to check for, you want to get your mobile up and running again as quickly as possible, with the minimum of fuss along the way, and that's where this guide can hopefully lend a hand. Fortunately, today's smartphones - with their limited file system access, carefully guarded app stores and touchscreen interfaces - are a lot easier to troubleshoot than laptops, car engines or cloud services, so you don't have to be a technical expert to work out a fix. In fact, Android comes with a set of troubleshooting tools that can be used to solve almost any problem: essentially, you're going to reset the app you're having trouble with, or reset the entire phone, and this fresh start should theoretically wipe your issues away. However, the same can't be said if you smash your screen or drop your (non-waterproof) phone in the sink - if you've got a faulty hardware problem then you're going to have to consult the experts at the local repair shop. If you lose your smartphone, or it gets stolen, then make sure you check out our guide on how to survive when your smartphone goes missing. For everything else, this guide should help.

Prev Page 1 of 11 Next Prev Page 1 of 11 Next First, some detective work is required: are you having problems with one app in particular, or your Android device as a whole (with bugs, crashes or whatever)? If it's the latter, focus your attention on that app. Tap the square Overview button on your phone, then swipe left or right on the specific app to remove it from memory. That should be enough to force the app to restarting from scratch the next time you load it - any buggy code or file that was in your Android phone's memory should be wiped away. A quick way of doing this for all your apps is to reboot the phone (the old 'turn it on and off again' technique beloved by IT support staff). Best Android apps 2016: 100 you must download Prev Page 2 of 11 Next Prev Page 2 of 11 Next If that doesn't work you can go in a little bit deeper with your cached data clearout. Every app stores a certain amount of data locally on your phone - it means loading times are faster and the app doesn't have to check the web as frequently. Problems with the cached data can eventually lead to bugs, however. Open up the main Android Settings app, tap Apps, choose your problematic app from the list on screen, then tap Storage and Clear Cache. For an even more severe 'reset', choose Clear Data (which returns the app back to the way it was when you first installed it). Load up the app again to see if the issue is fixed. Prev Page 3 of 11 Next Prev Page 3 of 11 Next As well as clearing data from inside an app you can uninstall it completely: these two procedures essentially do the same job of wiping out any data associated with an app, data that may have become corrupted or which may be causing an app to crash. You can then start again afresh with the app. To uninstall an app on Android, head to its entry in the Apps screen, or tap and hold on an icon in the app drawer and drag it up to the Uninstall label at the top (note that native Android apps can't be uninstalled). A confirmation message appears on screen and after a few seconds the app is uninstalled. Prev Page 4 of 11 Next Prev Page 4 of 11 Next Uninstalling apps you don't need is a great way to clear up storage space on your phone - if you're very low on space then this can lead to a variety of bugs, from apps misbehaving to random resets. So, it's a good idea to keep the number of apps you've got installed on your Android device down to a minimum. If you do still need the app we're dealing with, reinstall it from the Google Play Store (any past purchases will be remembered, so you won't have to pay again) - if the problem is solved, great; if not, try getting in touch with the app developer directly (there should be a link on the app's listing on the Play Store). Still got storage space problems? Move your Android phone apps to an SD card. Prev Page 5 of 11 Next Prev Page 5 of 11 Next If you're having problems connecting to Wi-Fi or a cellular signal then you need to make sure it's actually your Android phone and not the network itself that's at fault. The easiest way to do this is to use a different device to test the network, though you may not always have another one with you. As with apps, a quick reboot often does wonders - and the easiest way to do a quick reboot of your Bluetooth, cellular and Wi-Fi networks is to put your phone into aeroplane mode for a few seconds and then back out again. Switching your phone on and off runs through the same process but takes longer. How to get super-fast Wi-Fi in every room Prev Page 6 of 11 Next Prev Page 6 of 11 Next By reconnecting to a troublesome network, you're forcing your Android phone to make the connection again from the beginning - as with clearing cached app data, this simple act of resetting is more effective than you might think at wiping away problems you're having with your phone. For a more thorough 'reset' of a Bluetooth or Wi-Fi connection, try telling the phone to forget it completely (through the relevant entry in the Settings menu) - wait a few minutes and try connecting again. It's also worth resetting the other device (which would be your router if you're struggling to get online). Prev Page 7 of 11 Next Prev Page 7 of 11 Next Switching your phone off and on is something of a troubleshooting cliché but only because it works. It covers a lot of what we've already talked about, forcing apps and data connections, and the phone itself, to forget everything in its recent memory and start up again with a clean slate. If your phone has completely crashed and the power button doesn't seem to be working, try holding down the power button and the volume down button at the same time to perform what's known as a hard reboot. This is the equivalent of removing the device's battery and forcing a more complete restart. Prev Page 8 of 11 Next Prev Page 8 of 11 Next A lot of people experience problems with a quickly draining battery, which (unfortunately) is an inevitable part of a phone getting older. If you've bought a handset with a removable battery then you can pop in a new one, but otherwise you're just going to have to keep close to a power source at all times. This is another problem where uninstalling apps can help: go to 'Battery' in Settings to see which apps are hogging all the juice and get rid of any you don't need. Turning off Wi-Fi and Bluetooth when they're not needed and reducing the display brightness and screen timeout duration can also help. Prev Page 9 of 11 Next Prev Page 9 of 11 Next This is the 'nuclear' option that wipes everything off your phone and makes it brand new again - you're then free to reinstall all your apps again or start off fresh. The factory reset option is under the 'Backup & reset' option in Settings and should be enough to solve the majority of software problems on Android. Bear in mind though that all the data on your handset is going to be erased - saved games, photos taken on your mobile, movies downloaded from the web, app passwords, messenger conversations, emails... make sure you have all of this data backed up somewhere else (if you care about losing it). The ultimate Android data recovery guide Prev Page 10 of 11 Next Prev Page 10 of 11 Next If your problem isn't solved after a factory reset, then either you're using software not intended for your handset, or there's some physical damage to the device that's stopping it from running properly. A factory reset puts the phone back to the state it was in when you first unboxed it, so there shouldn't be any issues. A lot of problems come with age, and it's usually inevitable that older handsets don't run as quickly as they get successive, newer Android updates over the air: again, keeping the number of installed apps down to a minimum can help, as well as offloading personal files (like photos) to the web or another device. Best cloud storage for photos: 6 top options tested and rated Prev Page 11 of 11 Next Prev Page 11 of 11 Next
